In class programming: 1. Save the model and use the saved model to predict on new text data (ex, "A lot of good things are happening. We are respected again throughout the world, and that's a great thing.@realDonaldTrump")

0]:
```
for idx, row in data.iterrows():
    row[0] = row[0].replace('rt', ' ') #Removing Retweets
```

1]:
```
max_fatures = 2000
tokenizer = Tokenizer(num_words=max_fatures, split=' ') #Maximum words is 2000 to tokenize sentence
tokenizer.fit_on_texts(data['text'].values)
X = tokenizer.texts_to_sequences(data['text'].values) #taking values to feature matrix
```

2]:
```
X = pad_sequences(X) #Padding the feature matrix

embed_dim = 128 #Dimension of the Embedded layer
lstm_out = 196 #Long short-term memory (LSTM) layer neurons
```

3]:
```
def createmodel():
    model = Sequential() #Sequential Neural Network
    model.add(Embedding(max_fatures, embed_dim,input_length = X.shape[1])) #input dimension 2000 Neurons, output dimension 12
    model.add(LSTM(lstm_out, dropout=0.2, recurrent_dropout=0.2)) #Drop out 20%, 196 output Neurons, recurrent dropout 20%
    model.add(Dense(3,activation='softmax')) #3 output neurons[positive, Neutral, Negative], softmax as activation
    model.compile(loss = 'categorical_crossentropy', optimizer='adam',metrics = ['accuracy']) #Compiling the model
    return model
# print(model.summary())
```

4]:
```
labelencoder = LabelEncoder() #Applying label Encoding on the label matrix
integer_encoded = labelencoder.fit_transform(data['sentiment']) #fitting the model
y = to_categorical(integer_encoded)
X_train, X_test, Y_train, Y_test = train_test_split(X,y, test_size = 0.33, random_state = 42) #67% training data, 33% test da
```

5]:
```
batch_size = 32 #Batch size 32
model = createmodel() #Function call to Sequential Neural Network
model.fit(X_train, Y_train, epochs = 1, batch_size=batch_size, verbose = 2) #verbose the higher, the more messages
score,acc = model.evaluate(X_test,Y_test,verbose=2,batch_size=batch_size) #evaluating the model
print(score)
print(acc)
```
